JOHN P. WOODFORD, DIRECTOR

January 9, 1974

Mr. Sam F. Cryderman
Deputy Director
Bureau of Transportation Planning

Dear Mr. Cryderman:

This report shows the probable savings in motor fuel that we believe could be realized if a 50 M.P.H. speed limit, a 55 M.P.H. speed limit, or a 60 M.P.H. speed limit were invoked and if reasonable compliance were achieved. The analysis was prepared by Mr. Richard E. Esch, Supervisor of the Statewide Studies Unit. Mr. Terry Gotts assisted in the final preparation.

Sincerely,

A handwritten signature in cursive script that reads "Keith E. Bushnell".

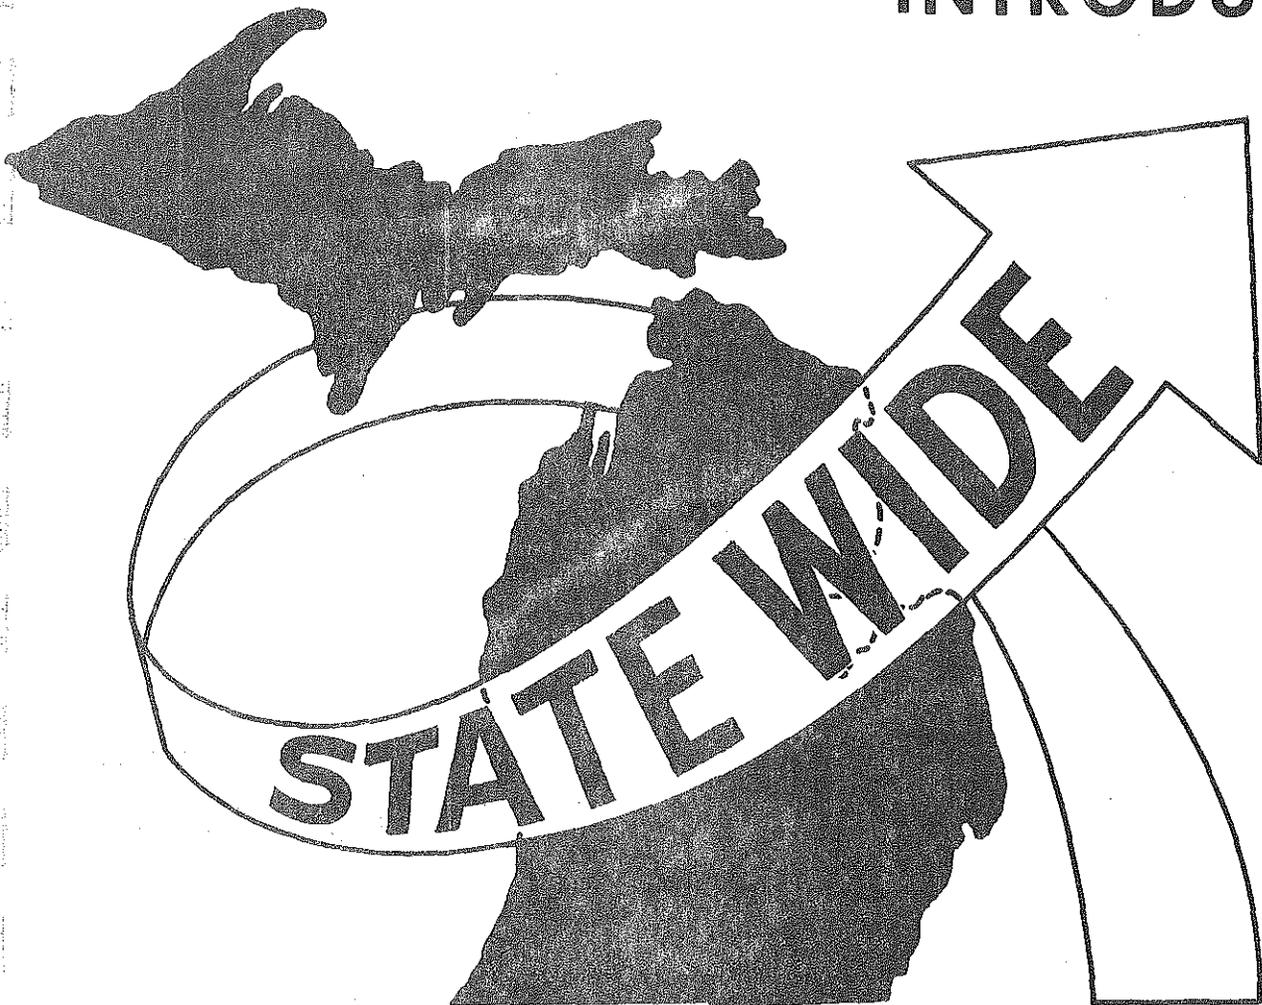

Keith E. Bushnell
Engineer of Transportation
Survey and Analysis Section

<u>SPEED LIMIT IMPACT ANALYSIS</u>	10
<u>CONCLUSION</u>	20
<u>APPENDIX</u>	21

INTRODUCTION

INTRODUCTION

This analysis was completed in order to determine the probable impact that a statewide speed limit might have on a motor fuel consumption in the State of Michigan. For the purposes of this study it was assumed that the most likely speed limit would be 50 M.P.H. Additional analyses were also completed for both a 55 M.P.H. speed limit and also a 60 M.P.H. speed limit.

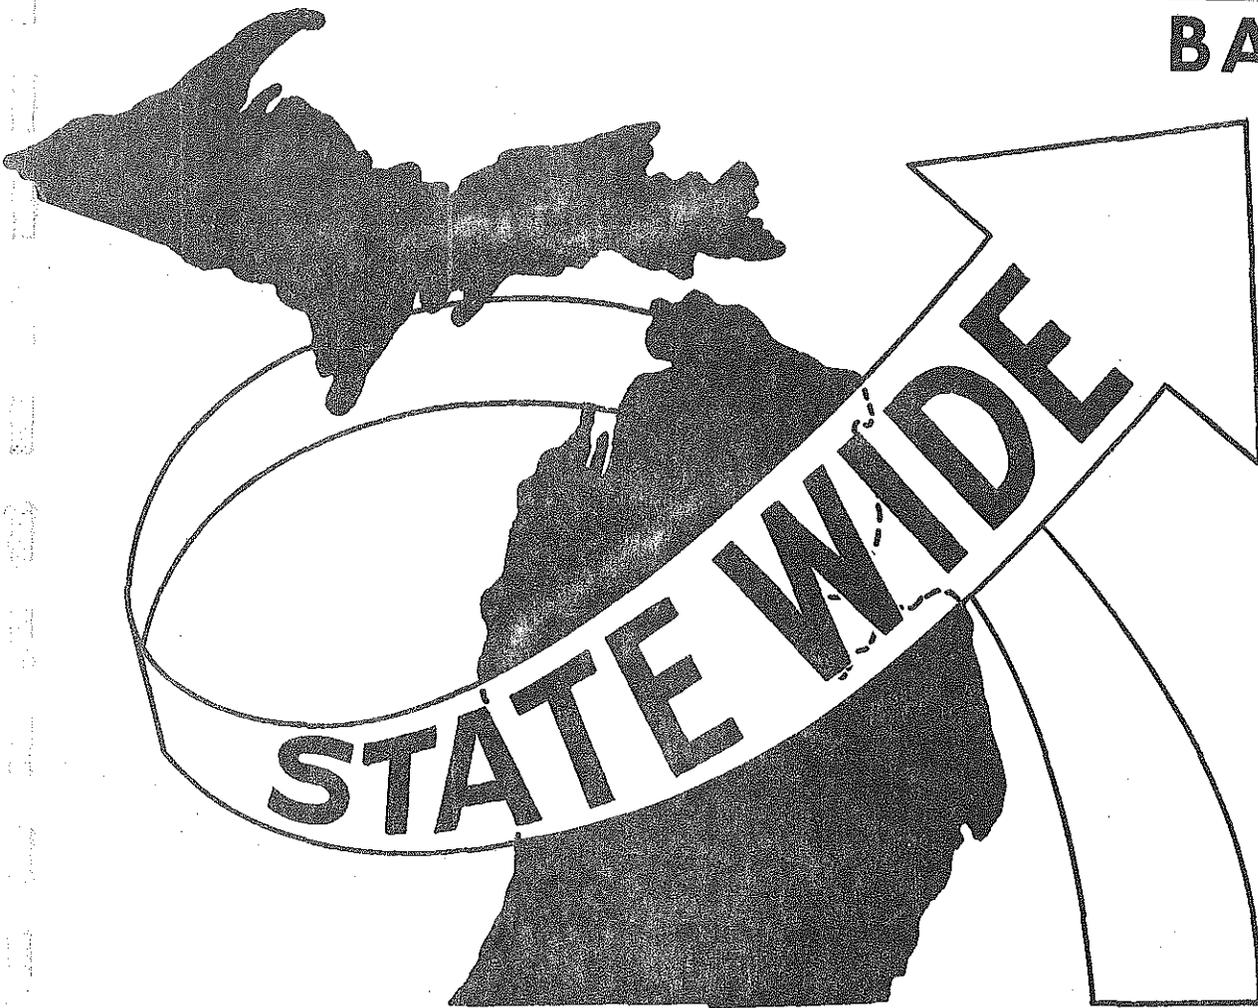

Three basic data sources were used to complete this analysis. They were:

1. 1972 U.S. Department of Transportation, Table T.A. 1 for Michigan.
2. Text book by Robley Winfrey entitled Economic Analysis for Highways.
3. Michigan Department of State Highways and Transportation Report #66 entitled Speed Report, April 1972.

Analysis completed in this document is intended solely as an initial inquiry. The results obtained are based upon several judgemental assumptions and use of this information must be based upon full knowledge of these assumptions.

DATA

BASE

DATA BASE

For this study the annual vehicle miles by each of these highway types was obtained from Table TA-1 (special report submitted annually to the Federal Highway Administration) for Michigan. The annual vehicle miles (millions) for 1972 by type appear in the final column in Figure 1.

HIGHWAY SYSTEM ANNUAL VEHICLE MILES

<u>Class Number</u>	<u>Highway Type</u>	<u>1972 Annual Vehicle Miles (Millions)</u>
01	Interstate Rural	3706
02	Interstate Urban	5094

11	Local Rural	3157
12	Local Urban	7662
—	All Others	<u>10378</u>
	TOTAL	57817

FIGURE 1

The data used to complete the final analysis was based on a division of the highway system in Michigan into 13 categories. The first column in Figure 1 is the numeric code assigned each of the 12 classes of highways. A description of each highway type appears in the second column.

The data used to estimate gasoline consumption was obtained from Appendix A of a text book by Robley Winfrey entitled Economic Analysis for Highways (1969). The gasoline consumption rates used are for an average 4,000 lb. passenger car and are shown in Figure 2. It has been assumed for this study that all grades are level as no information was available on grades by highway type. No differentiation was made for car and trucks.

GASOLINE CONSUMPTION AT UNIFORM SPEED ON THE LEVEL

EXISTING - - - PROPOSED

Motor fuel consumption is directly related to the speed that each vehicle is traveling so the third source of travel data required to complete a realistic evaluation of the impact speed limit changes might have is speed data. The Michigan Department of State Highways and Transportation collects speed data four times a year. The data is typically collected during the months of January, April, July and October at the stations appearing in Figure 3. The speed study inventory for April 1972 was selected for this analysis as this data most represents an average day. Any other month or year could be substituted if desired. Figure 4-7 are summary tables of the April 1972 speed study results.

These three data sources complete the data base used in the following analysis. Any individual having more refined information can quickly take the initial annual vehicle miles information and complete additional analyses if desired.

SPEED

LIMIT

IMPACT

ANALYSIS

SPEED LIMIT IMPACT ANALYSIS

The annual vehicle miles by highway type and the speed data for April 1972 were combined into the chart shown in Figure 8. The information in this chart was used as a base for all study analysis. This chart indicates what percent of the travel occurs in each speed group for each highway class except "all others" as most of this travel is under 50 M.P.H.

SPEED DISTRIBUTION OVER 50 M. P. H. PERCENT

Highway Classes	Annual Vehicle Miles	Speed Groups					
		50-55	55-60	60-65	65-70	70-75	75-80
01*	3706	4.1	11.2	21.1	26.8	24.4	10.7
02	5094	21.1	26.8	24.4	8.9	1.5	0.3
03*	7607	14.4	21.3	22.0	18.2	10.2	2.4
04*	7771	10.0	1.0	-----	-----	-----	-----

07*	7412	19.8	27.2	18.4	9.8	3.5	0.3
08	2607	10.0	1.0	-----	-----	-----	-----
09	35	19.8	27.2	18.4	9.8	3.5	0.3
10	81	10.0	1.0	-----	-----	-----	-----
11	3157	9.8	3.5	0.3	-----	-----	-----
12	7662	-----	-----	-----	-----	-----	-----

*ACTUAL SPEED DATA

FIGURE 8

Actual speed data (Figure 4-7) is available for only four classes as indicated by the asterisk in Figure 8. These classes were 01, 03, 04 and 07. Speed data percentages for 02 which is interstate urban freeway were assumed to have a distribution similar to the 01 class which is interstate rural. All percentages were skewed to the left two columns (10 M.P.H.) because the present speed limit is 70 M.P.H. for rural interstate and 60 M.P.H. on most urban interstate routes. Class 05 was assumed to be similar to the 03 class as their basic design is similar -- only the Federal aid designation is different. The actual 04 classification speed distribution was assumed to apply to 06, 08 and also 10 for the reason that design standards within urban areas for these classes does not appear to vary enough to effect speed distribution changes.

The 11 classification is very similar to the 07 classification except that it may include "gravel type" highways and typically the speed limits tend to be around 50 M.P.H. rather than the 65 M.P.H. of the 07 classification; therefore the 11 class speed distribution is the 07 distribution skewed to the left three columns to represent the 15 M.P.H. class differential.

Class 12 was assumed to have an average speed of 25 M.P.H. for this study as no information is presently available which might be applicable. Additional speeds in this class most probably fall below the 50 M.P.H. speed limit and will not affect the results of this study.

Travel above 80 M.P.H. was included in the 75-80 M.P.H. group, as Winfrey's gasoline consumption tables do not go beyond 80 M.P.H. This affects only the 01 classification and includes only 1.8 percent of the vehicles in this class.

Figure 9 is a summarization of the annual vehicle miles in millions that presently occur in each speed group by highway class. These data may be used for analysis involving all three speed limits. The entire table is used in the 50 M.P.H. analysis; all but the left-most ("50-55") column is used in the 55 M.P.H. analysis; and all but the left-most two columns are used for the 60 M.P.H. calculations.

FIGURE 9 *Final Analysis: 50,55,60
+Final Analysis: 50,55 only

These are the annual vehicle miles by each category that will be used to calculate probable motor fuel consumption reductions. Highways where the present speed limit is 50 M.P.H. or less have been eliminated from the analysis as speed limit changes in these areas generally will be inconsequential. In the 50 and 55 M.P.H. speed limit analysis classes 01, 02, 03, 05 and 07 were used. For the 60 M.P.H. analysis only four classes (01 03 05 and 07) were included.

It has also been assumed that speed percentage distributions for these five classes will remain the same except for a skewing to the left because of lower speed limits. The skewing was accomplished by comparing the present speed limit with each proposed speed limit. For example, in the 50 M.P.H. case, class 01 has a present speed limit of 70; therefore it was assumed those presently driving 55 M.P.H. would drive 50 M.P.H., those driving 60 M.P.H. would drive 50 M.P.H., those driving 65 would drive 50 M.P.H. and those driving 70 would drive 50 M.P.H.. These four groups were individuals who followed the speed limits in the past and for this study it is assumed they will continue. Finally it is assumed that those who exceed the speed limit continue to do so and the 75 M.P.H. group was adjusted to 55 M.P.H. and the 80 M.P.H. group was adjusted to 60 M.P.H. This same process was applied to the other four highway classes. Finally the above procedure was also used for the 55 and 60 M.P.H. cases.

Figure 10 shows the probable results of the speed limit changes and a redistribution of vehicle miles in millions by speed change grouping. Figure 10-A identifies 13 speed change groups for which motor fuel reduction analysis was calculated for the 50 M.P.H. speed limit.

**VEHICLE MILES IN MILLIONS BY SPEED CHANGE GROUP

ASSUMING 55 M. P. H. SPEED LIMIT

SPEED CHANGE GROUPS	CONSUMPTION RATES	GALLONS SAVED PER 1000 V.M.
60 MPH to 55 MPH	57.6 gal. -53.2 gal.	4.4 gal. savings
65 MPH to 55 MPH	63.1 gal. -53.2 gal.	9.9 gal. savings
70 MPH to 55 MPH	70.0 gal. -53.2 gal.	16.8 gal. savings
75 MPH to 60 MPH	78.7 gal. -57.6 gal.	21.1 gal. savings
80 MPH to 65 MPH	90.4 gal. -63.1 gal.	27.3 gal. savings
65 MPH to 60 MPH	63.1 gal. -57.6 gal.	5.5 gal. savings
70 MPH to 65 MPH	70.0 gal. -63.1 gal.	6.9 gal. savings
75 MPH to 70 MPH	78.7 gal. -70.0 gal.	8.7 gal. savings
80 MPH to 75 MPH	90.4 gal. -78.7 gal.	11.7 gal. savings
70 MPH to 60 MPH	70.0 gal. -57.6 gal.	12.4 gal. savings
75 MPH to 65 MPH	78.7 gal. -63.1 gal.	15.6 gal. savings
80 MPH to 70 MPH	90.4 gal. -70.0 gal.	20.4 gal. savings

65 60	4181000000VM x	5.5 gal./1000VM =	22,995,500 gal.
70 60	9930000000VM x	12.4 gal./1000VM =	12,313,200 gal.
75 65	9040000000VM x	15.6 gal./1000VM =	14,102,400 gal.
80 70	3970000000VM x	20.4 gal./1000VM =	8,098,800 gal.
70 55	2409000000VM x	6.9 gal./1000VM =	16,622,100 gal.
75 60	1202000000VM x	8.7 gal./1000VM =	10,457,400 gal.
80 65	2440000000VM x	11.7 gal./1000VM =	2,854,800 gal.
TOTAL ANNUAL GALLONS SAVED =			87,444,200 gal.

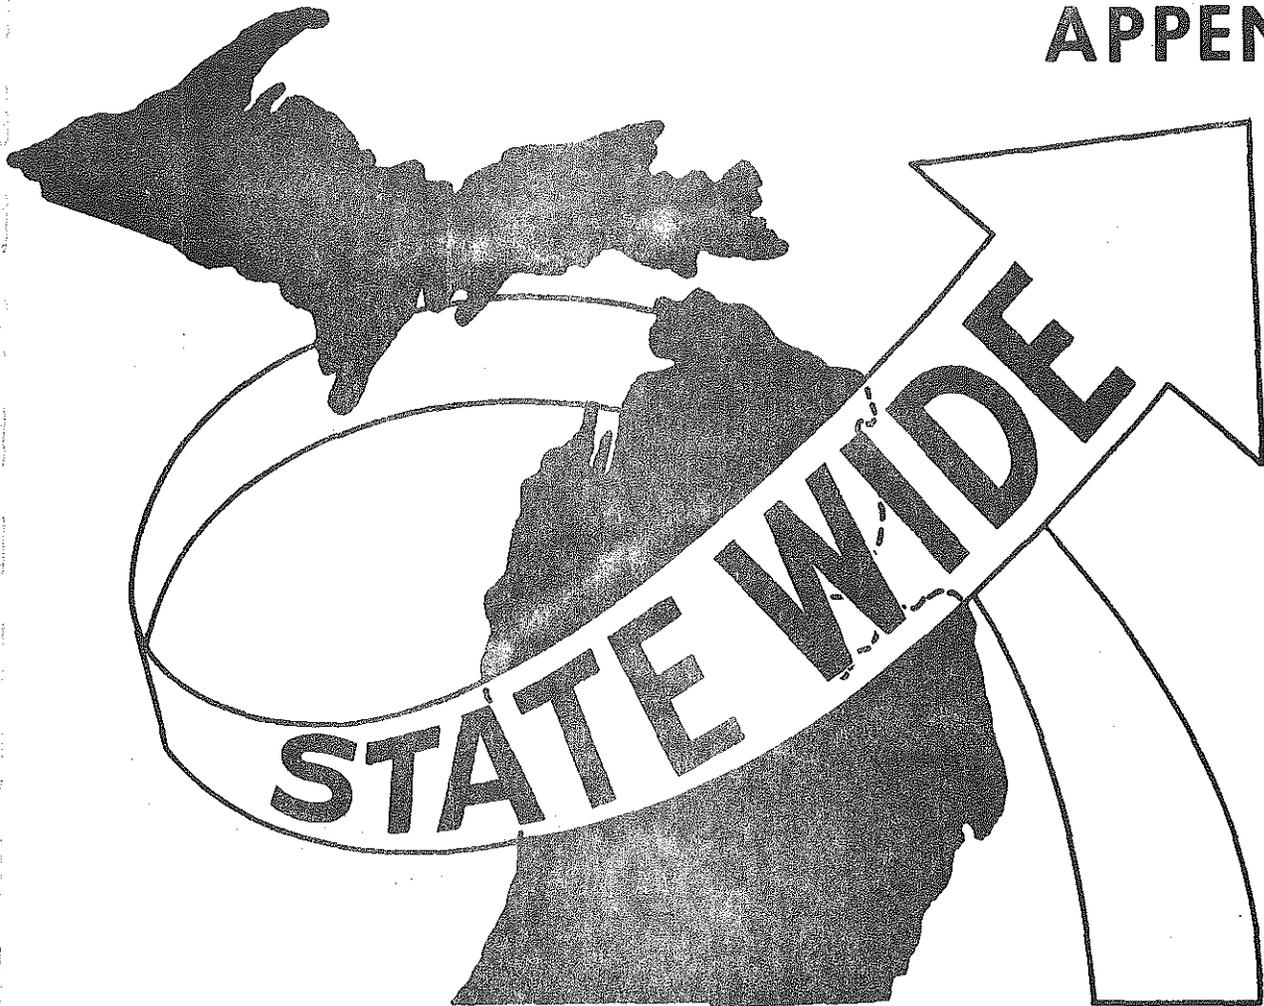

CONCLUSION

CONCLUSION

As indicated in the 1972 Table TA-1, approximately 4,363,000,000 gallons of motor fuel were consumed in Michigan in 1972. A 50 M.P.H. speed limit would appear to save about 265 million gallons--approximately 6 percent of the total--annually. If a 55 M.P.H. speed limit were initiated, the annual gasoline savings would be about 178 million gallons, or 4 percent of the 1972 total. Finally, a 60 M.P.H. speed limit would probably result in a 2 percent decrease in gasoline consumption, approximately 87.5 million gallons per year.

APPENDIX

APPENDIX

The analysis in this report is based upon the assumption that there will be reasonable compliance with whichever new speed limit is implemented. Figures 13 A-B+C show a graph of speeds measured during the World War II speed limit of 35 M.P.H. This graph shows only average speeds; no information is available which shows the speed distribution or violations. As can be seen, the speed limit was very effective for a short time.
