MICHIGAN DEPARTMENT OF TRANSPORTATION

SPECIAL PROVISION FOR WARRANTY WORK REQUIREMENTS FOR HOT MIXED ASPHALT PLACED ON CRUSH AND SHAPED BASE

CFS:DJW

1 of 2

APPR:KPK:RAG:03-10-20 FHWA:APPR:03-13-20

a. Description. This special provision must be used in conjunction with 20SP-500A - Materials and Workmanship Pavement Warranty to construct warranted pavement for hot mix asphalt (HMA) pavement placed on a crush and shaped base.

b. Limits of Warranted Work. The warranted work includes all HMA on driving lanes within the project limits unless otherwise indicated on the plans.

c. Warranty Term. The warranty term will be 5 years from the date of Initial Acceptance otherwise termed the Acceptance Date of Construction.

d. Warranty Bond. Supply a warranty bond equal to \$800,000.00 or five percent of the total contract amount, whichever is less.

e. Initial Ride Quality Acceptance Criteria. Initial Ride Quality requirements are specified in the contract.

f. Warranty Requirements. Table 1 lists the allowable threshold limit for each condition parameter within each segment and the maximum number of allowable segments within a driving lane for each condition parameter. If any of the warranty requirements are not met, as a result of a defect in materials and/or workmanship, corrective action (warranty work) is required.

The defective segments for surface distress may or may not be contiguous to necessitate corrective action. The maximum allowable number of defective segments for each condition parameter applies to each driving lane in each travel direction. Ensure each driving lane is evaluated independent of adjacent driving lanes. Ensure any pavement surface requiring removal/replacement to correct deficiencies, for any condition parameter, is replaced full-width across the driving lane.

g. Corrective Actions. Table 2 lists recommended corrective actions to provide typical acceptable treatments for the various condition parameters. The Department will accept the listed corrective action if the action addresses the cause of the condition parameter. The Contractor may use an alternative action subject to Department approval.

Condition Parameter (d)	Threshold Limits Per Segment (Length = 1/10 mile)	Max. Defective Segments Per Driving Lane-Mile (a)	
Transverse Cracking	4	1	
Longitudinal Cracking/ Open Joint	10% of segment length	1	
De-bonding	5% of segment length	1	
Raveling	8% of segment length	1	
Flushing	4% of segment length	1	
Rutting (c)	avg. rut depth = 3/8 inch (b)	1	

Table 1: Warranty Requirements

a. The maximum allowable number of defective segments per driving lane is determined by multiplying by the length of the specific driving lane in miles

b. The rut depth threshold applies to each wheel path independently.

c. The pavement surface will be evaluated for the presence of rutting on each driving lane throughout the warranty period. The pavement surface will be measured beginning at the POB and every 132 feet thereafter to determine average rut depth to quantify rutting for a particular 1/10 mile segment.

Rut measurements will be done using a straight rigid device that is a minimum of 7 feet long and of sufficient stiffness that it will not deflect from its own weight, or a wire under sufficient tension to prevent sag when extended 7 feet. Measurements will be taken by placing this "straightedge" across the pavement surface perpendicular to the direction of travel. The straightedge must contact the surface on at least two bearing points with one located on either side of the rut. The straightedge is properly located when sliding the straightedge along its axis does not change the location of the contact points. Rut depth is then measured at the point of greatest perpendicular distance from the bottom of the straightedge to the pavement surface.

d. Alligator and/or Block Cracking will not be an acceptable condition, and will be removed and replaced as approved by the Engineer.

Condition Parameter (b)	Recommended Action		
Transverse Cracking	Cut and Seal		
Longitudinal Cracking/Open Joint	Cut and Seal		
De-bonding	Mill and Resurface affected courses		
Raveling	Mill and Resurface affected courses		
Flushing	Mill and Resurface top course		
Rutting	Microsurface or Mill and Resurface (a)		
a. Recommended action is dependent on the depth of the rut susceptible material.			
b. Any areas exhibiting Alligator or Block Cracking must be removed and replaced as directed by the Engineer.			

Table 2: Recommended Corrective Actions
