PREFACE

This compilation of essential design and construction data pertaining to concrete pavement on the state trunkline system was prepared as a ready means of determining this information for any construction project or section of pavement.

In compiling this data various sources of information were studied; records from Estimate Engineers Office, the Planning and Traffic Control Section Records, and Testing and Research Division Records both in Lansing and Ann Arbor. Also, records from the general files and, in some cases, information obtained from District Offices were used to augment the previously mentioned sources. In the case of certain projects some information is still incomplete and any missing data that may become available later will be added in future revisions.

It will be noted that certain information has been coded directly using actual figures, as in the case of the control section, project and contract number, year, length, thickness, width, average daily traffic, year of traffic survey, and year

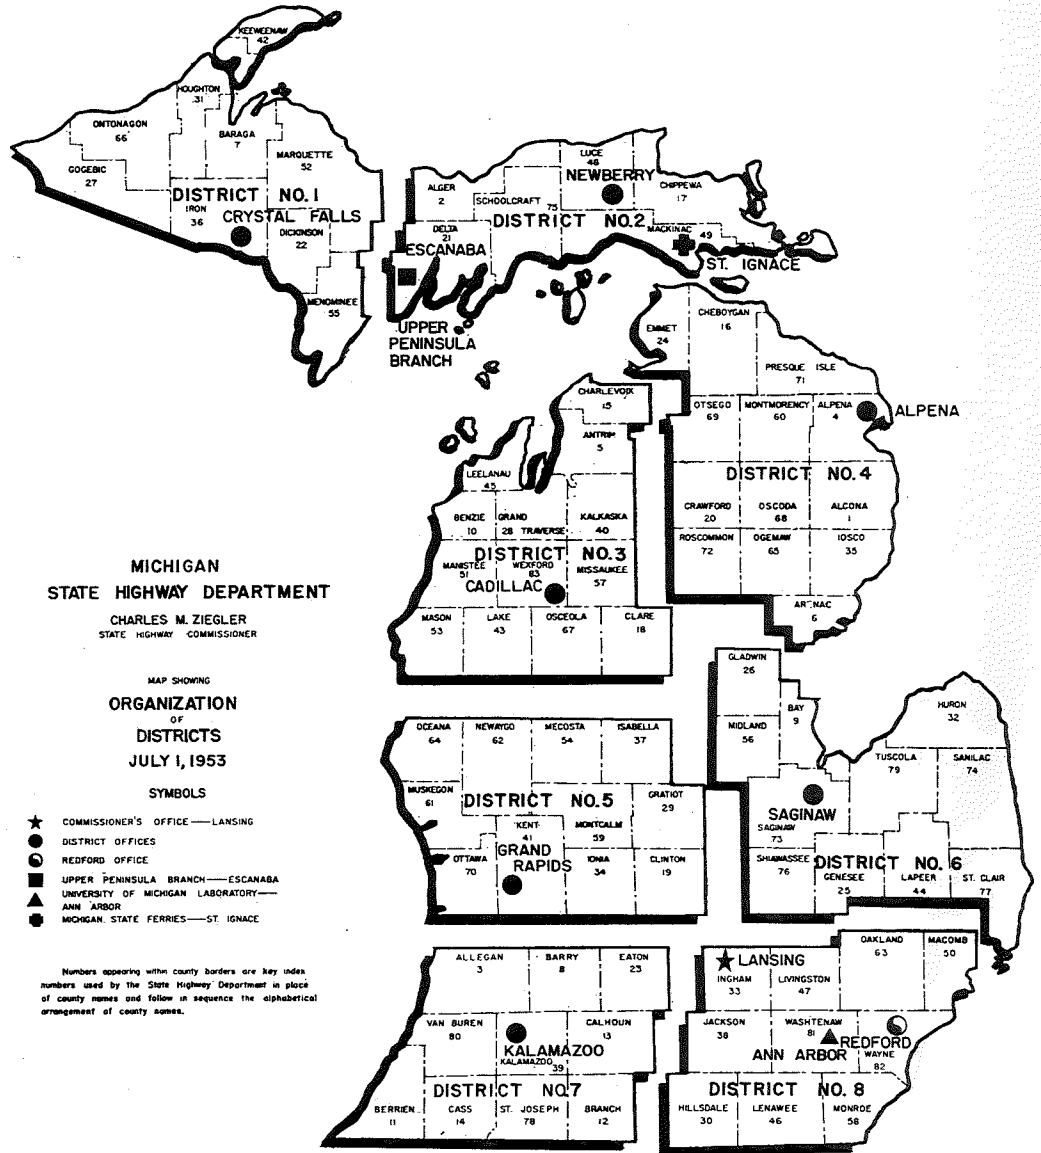

retired or resurfaced; whereas for information such as reinforcement, joint data, finishing, curing, materials, contractor, type of resurfacing, or method of retirement, it has been necessary to assign a code number which requires a key in order to convey the significance of the code number.

In certain instances, projects have been listed more than once, for example, where a project extends over more than one control section it is listed under each control section with the length of the project given as the length in the respective control section. Also, where more than one type of surfacing occurs in a given project, for example, concrete capping and normal construction, the project is listed twice, and the length given in each is applicable to the type of surfacing shown. This same procedure is used where under a given project divided and undivided highway was constructed.

An index to the code key is given below.

Numbers appearing within county borders are key index numbers used by the State Highway Department in place of county names and follow in sequence the alphabetical arrangement of county names.

1. CONTROL SECTION NUMBER

The control section code is provided to conform to the Uniform Record System of the Department. This method establishes a five-digit number for identification purposes. The first two digits are the county number, the second two digits are the assigned road number within the county, and the last digit is the section number in numerical order along the road. For example: Allegan County, 03, Rd. No. 9, Sec. No. 2, is coded - 03092.

Counties are coded in accordance with the standard county numbering system.

2. PROJECT CODE

Project numbers are coded directly.
 For example:
 Project 31 031

3. CONTRACT

Contract numbers are coded directly.
 For example:
 Contract C2 02

4. YEAR BUILT

The year that the project was completed or accepted is coded by the last two digits of that year.
 For example:
 Year 1939 39

5. LENGTH

The length of project is coded directly to the nearest 0.1 mile.
 For example:
 Length 7.542 075

6. THICKNESS

The thickness of the pavement is coded directly. For projects consisting of concrete capping, the letter "C" precedes the edge and center thickness where the cap is the same width as the existing pavement. Where the cap extends beyond the width of the existing pavement, the letter "W" precedes the edge thickness to indicate the thickness of this widened portion. The minimum thickness of cap is indicated.

For example:

<u>Thickness</u>	<u>Edge</u>	<u>Center</u>
9"-7"-9"	090	070
8" uniform	080	080
5" capping	C50	C50
Widening 2" thick with 5" capping . .	W12	C50
When widening & capping are variable	WV0	CV0
When thickness is variable	0V0	0V0
No record	999	999

7. WIDTH

The width of the pavement is coded to the nearest foot.
 For example: CODE

Undivided highways - 22 feet	022
Widening	W10
Variable width	0V0
Divided highways (2 roadways) - 24 feet . .	D24
Variable width	DV0

8. REINFORCED

The reinforced concrete is coded as follows: CODE

Not reinforced	00
Reinforced, type not given	01
Partially reinforced	02
Bar mat	03
Expanded metal	04
Wire mesh (standard)	05
Several types of reinforcing	06
Wire mesh (light weight)	07

* Expansion joint spacing code 01 refers to the 1946 Standards E-4-A-127 and E-4-A-135, in which such joint spacing depends upon time of year and whether of urban or rural construction.

** This joint spacing effective June 3, 1948 replaced 400-foot spacing coded 1.

12. FINISHING

A longitudinal float, hand or mechanically operated, was first required in supplemental specifications on July 13, 1938. It became a standard in 1940. On May 21, 1941, supplemental specifications required a mechanical longitudinal float and this requirement became standard in the 1942 Standard Specifications. The longitudinal floating follows the finishing machine operations.

14. AVERAGE DAILY TRAFFIC

A. Volume

The average daily traffic volume is coded directly, for example:

CODE

Traffic volume 8623 vehicles-08623
No traffic record 00000

B. Year

The year of the traffic volume study is coded by the last two digits of that year, for example:

CODE

1947 47
No traffic record 00

On divided highways where traffic count has been obtained for both directions separately, the average is used as constituting the volume per two-lane pavement.

15. CEMENT
