

TRAFFIC AND SAFETY NOTE 222A

SUBJECT: Electrical Devices Installed On Construction Projects

PURPOSE: Determine Cost and Design Responsibilities

COORDINATING UNIT: Traffic Signals Unit

INFORMATION: Any new electrical device or change in the operation of an existing device must be approved by the Traffic Signals Unit prior to completion of the scoping process.

Any electronic traffic control device required due to work being done as part of a construction project shall be at the project=s expense (Act 51 Paragraph 247.651c) unless prior approval is given by Traffic and Safety.

The project manager shall hire a pre-qualified traffic signal design consultant to design all electronic traffic control devices on the project unless prior approval is given by Traffic and Safety.

Due to the difficulty of scheduling the installation of electrical devices in conjunction with construction projects, all new electrical devices and all existing electronic traffic control devices impacted due to a project shall be included in the project. Therefore, the contractor is responsible for the scheduling and erection of the device.

The Traffic Signals Unit will review change requests, design, and installation of electrical devices on construction projects.
