JOHN P. WOODFORD, STATE HIGHWAY DIRECTOR

February 21, 1973

Mr. Sam F. Cryderman
Engineer of Transportation Planning
Transportation Planning Division

Dear Mr. Cryderman:

The Transportation Survey and Analysis Section of the Transportation Planning Division is pleased to present a report entitled "Proximity of People to General-Purpose Hospitals." The report is an example of the use of the Proximity Analysis process in determining the impacts of a highway system upon health-care facilities. It points up another possible means of increasing interdepartmental participation in the transportation planning process by demonstrating impacts upon facilities of other units of state government.

The report shows the relationship of population to the locations of existing general-purpose hospitals throughout Michigan. The analysis was conducted with the cooperation of Mr. Robert Allen of the Department of Public Health.

Sincerely,

A handwritten signature in cursive script that reads "Keith E. Bushnell".

Keith E. Bushnell
Engineer of Transportation
Survey and Analysis Section

PREFACE

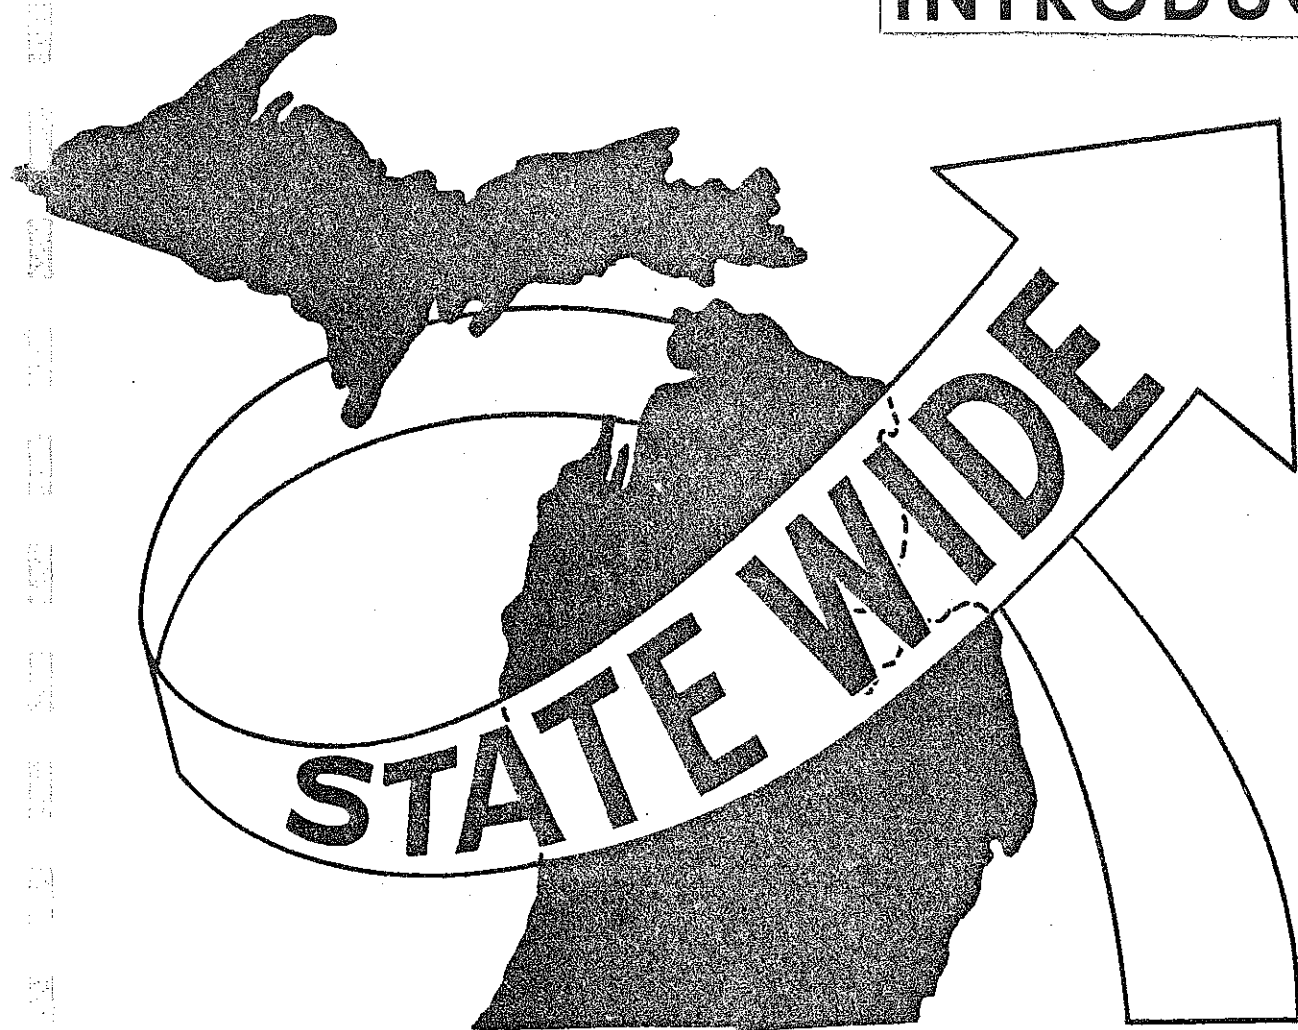

Preface

The Federal-Aid Highway Act of 1970 requires that each state must consider "economic, social, and environmental effects" of proposed Federal-aid highway projects. In addition, Section 109(h) of Title 23 USC stipulates that final decisions on highway projects must be made in the best overall public interest; impacts on public services are among the effects which must be monitored.

The set of guidelines for an Action Plan also point out that each agency must ensure that it can derive "timely information on social...effects." In this context, such social impacts should be monitored quickly enough so that the impact information keeps pace with the actual alternate development process, so that as soon as a possible alternate is selected, its effects can be identified. Thus immediate feedback can be used in the planning stages, rather than merely defining a set of alternates and later picking the best of the lot. This feedback would also facilitate community involvement in the planning process, resulting in increased public confidence in the process and more public support for the route ultimately selected.

This report is offered as an example of how such monitoring of social impacts can be done quickly and cheaply. Techniques such as this may ultimately save tax revenues by promoting greater inter-departmental communication and cooperation and reducing needless duplication of effort.

INTRODUCTION

Introduction

One social impact of a highway plan which can be monitored is the degree to which it brings large numbers of people close to existing health-care facilities. All other things being equal, one highway plan would be considered better than another if it made hospitals more accessible to more people.

The results will be presented from two distinct points of view. First, hospitals (or groups of hospitals) will be analyzed to see how many people lie within certain specified driving times from them. This shows the effect of the road network on the service potential of health-care facilities. Next, the state will be divided into small areas and each area will be examined to discover how many hospitals are within these driving times from it. This will determine which areas are under-served or perhaps over-served. A special list will be provided of those areas which cannot reach any hospital within the specified driving times. At present, the graphic capabilities associated with the process are somewhat limited; consequently, a copy of the actual computer printout is included in the appendices. New graphic methods of explaining the model's results are presently being investigated.

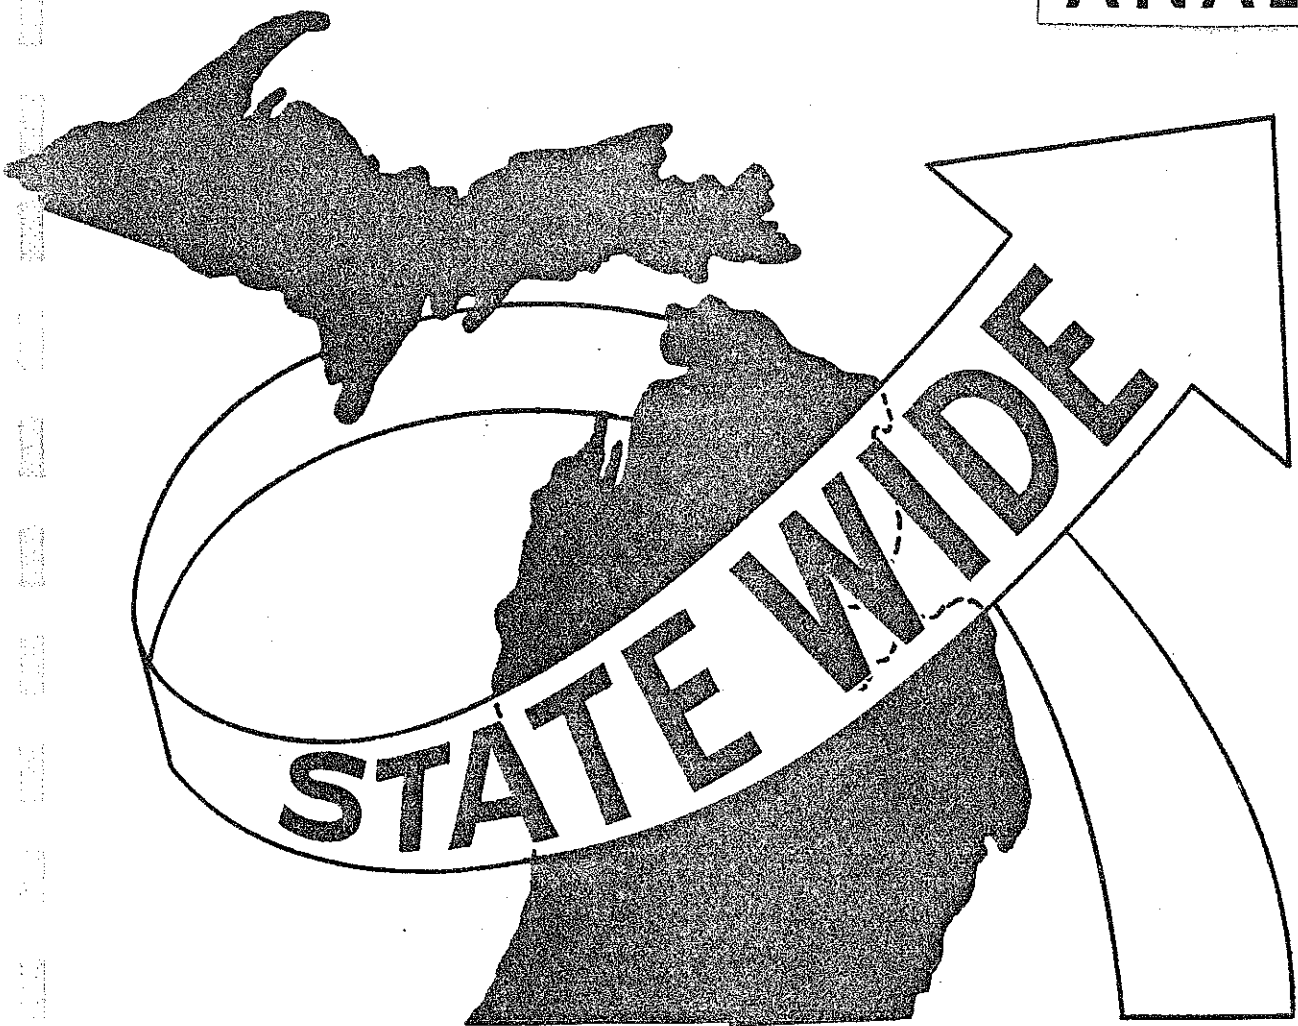

For this example, special-purpose hospitals (such as alcoholic centers, for example), old-age homes, and convalescent homes are excluded from the analysis insofar as

these could be identified. The locations of the hospitals were obtained from the Michigan Department of Public Health.

The reader should keep in mind that in this example only one highway system is being examined. In comparing alternative transportation plans, one would run the process once for each alternate--including the "do nothing" alternate--and then contrast the results. This technique would allow the rapid comparison of the impacts of many highway plans on public health facilities.

Finally, it also is apparent that this sort of analysis is not confined only to hospitals. The same process can be used to examine any system of public-service institutions at the total system level.

**METHOD OF
ANALYSIS**

Method of analysis

Michigan's Statewide Traffic Forecasting Model divides the state into 508 subareas, or "zones" (see figure 1). It has an associated highway network (shown graphically in figure 2) consisting of Interstate, state trunkline, and some selected county roads. Using average speeds on the links of this network, one can determine an average driving time from each zone to every other zone along the shortest-time route between them. It is then possible to specify, for each zone containing a hospital, which zones lie 0-20 minutes away, 20-40 minutes away, or 40-60 minutes away.

Two things must be kept in mind during the ensuing discussion. First, as has been stated, the link speeds used here are average speeds derived from highway department speed studies; in most cases, they are slower than the speed limit on the link. Second, the process does not subdivide zones: if it is determined that zone 15 lies 25 minutes away from hospital zone 22, it is assumed that the entire population of zone 15 lives 25 minutes from zone 22. This is a simplifying assumption which has not been found to significantly detract from the preliminary model results.

A township-level 2300-zone system is currently being developed. The fineness of the system and the homogeneous quality of its zones are expected to alleviate any problems associated with the coarser 547-zone system.

The population figures used in this run are taken from 1970 population data. Calculations are made using an automated process called Proximity Analysis developed by the Statewide Studies Unit, Transportation Planning Division. For a more detailed explanation of the process, the reader is urged to consult Statewide Transportation and Analysis Report volume I-D, "Proximity Analysis".

Figure 3 is a graphic illustration of the degree of concentration of health-care facilities in each of the 508 zones into which Michigan has been divided. The darkness of shading on the map (called a SYMAP printer-plot) is directly proportional to the number of hospitals in the zone. One notes immediately that more than two-thirds of the zones contain no hospital at all. Of those which do contain hospitals, the number of hospitals per zone ranges from one, in many places, to thirty-four, in downtown Detroit (zone 493). The locations of these hospitals was derived from the July, 1971 Directory of Hospitals, Nursing Care Facilities, and Homes for the Aged, prepared by the Bureau of Health Facilities, Michigan Department of Public Health.

SYMAP PLOT OF THE NUMBER
OF HOSPITALS PER ZONE

**HOSPITAL-SPECIFIC
RESULTS**

Hospital-specific results

Refer now to figure 4, an example of the "Population Proximity" results. This output endeavors to show how many people live within 20, 40 or 60 minutes' driving time of each Statewide zone which contains at least one hospital. The complete results for all hospitals in the state appear in Appendix A.

As an example of the output for a hospital zone, consider zone 7, in Allegan County. The upper-left-hand corner of the page contains the data for the zone itself; zone 7 has 10,961 people and one hospital ("server") having a capacity of 89 beds.

The first time band, 0-20 minutes, is empty except for the zone itself, because more than 20 minutes are required, on the average, to reach another zone centroid from the centroid of zone 7. All these people are classified as rural dwellers, and they comprise 0.124 percent of the total population of the state. The only hospital in the band is the one in zone 7, so the population-per-server ratio for the first time band is calculated as $(10,961 \text{ people}) / (1 \text{ server}) = 10,961 \text{ people/server}$.

Within 20-40 minutes driving time of zone 7, zones are encountered whose populations add up to 248,045 people, of whom 118,793 live in urban areas, 40,384 live in suburban areas, and 88,868 live in rural areas; this band has 2.795% of the people of Michigan. In addition, 7 hospitals

lie in the band, giving a population-per-server ratio of 34,435 people/server.

For the 0-40 minute cumulative band, note that there are 259,006 people and 8 hospitals within 40 minutes of zone 7. This results in a cumulative population-per-server ratio of 32,375.75.

Similarly, there are 640,661 people and 15 hospitals which lie between 40 and 60 minutes from zone 7, giving a population-per-server ratio of 42,710. In the cumulative 0-60 minute band, there are 899,667 people and 23 hospitals, for a population-per-server ratio of 39,115.96.

POPULATION PROXIMITY

DATA FOR ZONE 7
 POPULATION = 10961
 NUMBER OF SERVERS = 1
 TOTAL CAPACITY = 89

TIME BAND 0- 20 MINUTES
 POPULATION WITHIN BAND = 10961 , URBAN = 0 , SUBURBAN = 0 , RURAL = 10961
 = 0.124 PERCENT OF TOTAL POPULATION

NUMBER OF SERVERS IN BAND = 1
 POPULATION PER SERVER IN BAND = 10961.00
 WITHIN 0- 20 MIN., POPULATION = 10961
 NUMBER OF SERVERS = 1
 POPULATION PER SERVER = 10961.00

TIME BAND 20- 40 MINUTES
 POPULATION WITHIN BAND = 248045 , URBAN = 118793 , SUBURBAN = 40384 , RURAL = 88868
 = 2.795 PERCENT OF TOTAL POPULATION

NUMBER OF SERVERS IN BAND = 7
 POPULATION PER SERVER IN BAND = 35435.00
 WITHIN 0- 40 MIN., POPULATION = 259006
 NUMBER OF SERVERS = 8
 POPULATION PER SERVER = 32375.75

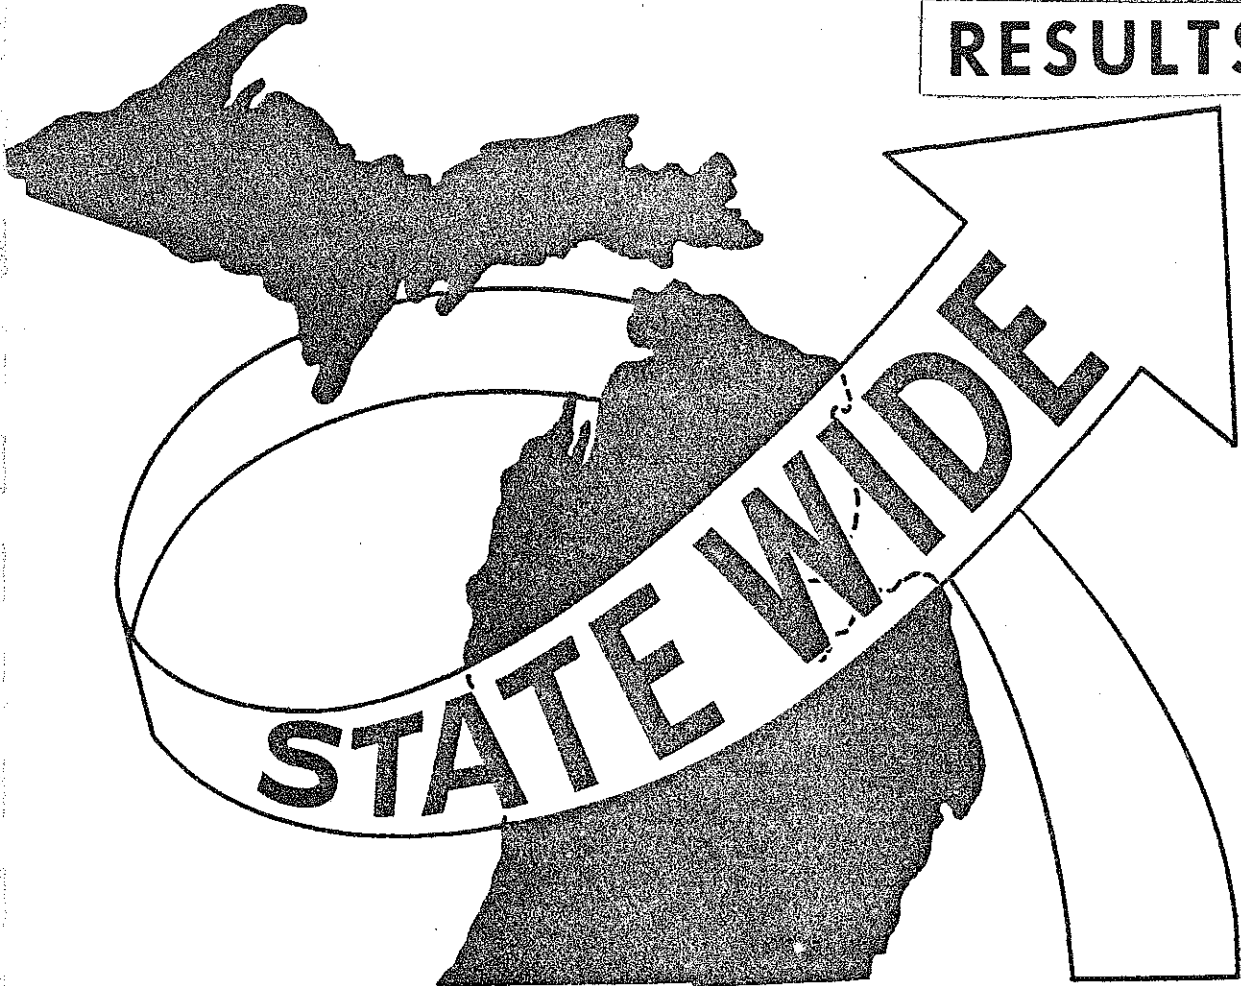

TIME BAND 40- 60 MINUTES
 POPULATION WITHIN BAND = 640661 , URBAN = 237498 , SUBURBAN = 320193 , RURAL = 82970
 = 7.219 PERCENT OF TOTAL POPULATION

NUMBER OF SERVERS IN BAND = 15
 POPULATION PER SERVER IN BAND = 42710.00
 WITHIN 0- 60 MIN., POPULATION = 899667
 NUMBER OF SERVERS = 23
 POPULATION PER SERVER = 39115.96

FIGURE 4:
 PROXIMITY OF PEOPLE
 TO EACH HOSPITAL ZONE

AREA-SPECIFIC

RESULTS

Area-specific results

The next set of outputs looks at hospital service from the point of view of the individual areas ("zones") being served. For each zone in the state (refer back to figure 1), the program calculates how many hospital zones (that is, zones which contain at least one hospital) lie within 0-20, 20-40, and 40-60 minutes driving time of the zone being served. In each time band, the total number of hospitals and the total bed capacity is calculated. In addition, the population of the served zone is divided by the number of hospitals in each time band to give a measure of the degree to which the zone is being served in that band; as before, this is expressed as a population-per-server ratio.

For example, refer to figure 5, which is a portion of the "server proximity" output (the complete output appears in Appendix B). Zone 1 has no hospitals within 40 minutes driving time, but within 40-60 minutes there are two hospitals with a total of 209 beds. Zone 2 has no hospitals at all within an hour's driving time of the center of the zone. Looking down to zone 5, one notes that although there are no hospitals within 0-20 minutes, there is one hospital zone containing one hospital which lies within 20-40 minutes driving time of zone 5. This hospital has only 34 beds, and the population/server ratio is $(2276/1)=2276$. Zone 5 is better-served within 40-60 minutes; in this time band there lies a zone with 3 hospitals and 407 beds, giving a population/server ratio in this band of 758.67, a significant improvement.

In figure 6, a summary is given of the zones not served by any hospital within a driving time of one hour. Such information could perhaps be of use to a planner who wished to locate a hospital in an area where it might be badly needed. These zones are shaded in the map of figure 7.

ZONE		SERVICE ZONES	SERVERS	CAPACITY	POPULATION/SERVER
1	0-	20MIN.	0	0	0.00

ZONES NOT SERVED
BY ANY HOSPITAL
WITHIN ONE
HOUR'S
DRIVING TIME**

As a further indication of the degree of service, figure 8 shows a SYMAP plot of the number of hospitals within sixty minutes' driving time of each zone. Displays such as this make it possible for a planner to spot problem areas in the state at a glance. As before, the darkness of shading is directly proportional to the number of hospitals which potentially serve the zone.

TIME FROM EACH ZONE**

CONCLUSION

Conclusion

Analyses of this type emphasize the complex inter-relationship of a transportation network and a group of service facilities. On the one hand, service facilities depend upon the transportation system: before a person can be helped by a hospital, for instance, he must first be able to reach that hospital. On the other hand, a highway network tends to create demand for service facilities: it is generally accepted that population tends to increase more quickly in an area which is more highly accessible to other areas of the state, and an increase in potential customers for a service demands more service facilities.

The technique demonstrated here is limited virtually only by the imagination of the user. For example, in combination with 1970 census data, the same technique could supply the proximity of senior citizens to nursing homes; all that would be necessary is the addition of nursing homes to the Statewide facility file. Nor is the process limited to relating facilities to population; for example, if all drug manufacturers were added to the facility file, one could calculate the proximity of hospitals to the drug companies which potentially supply them.

If a user wished to enter his list of existing or proposed facilities into the Statewide facility file, he then would be able to calculate the proximity of his facilities

to any socio-economic characteristic measured by the 1970 U.S. Census. Moreover, he would be able to relate them to any facility set currently residing in the Statewide facility file, namely:

HISTORIC SITES

HOSPITALS

AIRPORTS

WHOLESALE TRADE CENTERS

MAJOR PORTS

NON-PUBLIC COLLEGES

PUBLIC COMMUNITY COLLEGES

CITIES OVER 30,000 POPULATION

UNEMPLOYMENT OFFICES

MENTAL HEALTH CENTERS

CERTIFIED INDUSTRIAL PARKS

UNIVERSITIES

SKI RESORTS

SNOWMOBILE TRAILS

CBD'S OF CITIES OVER 5,000 POPULATION

TRUCK TERMINALS

RAIL TERMINALS

BUS TERMINALS

STATE POLICE POSTS

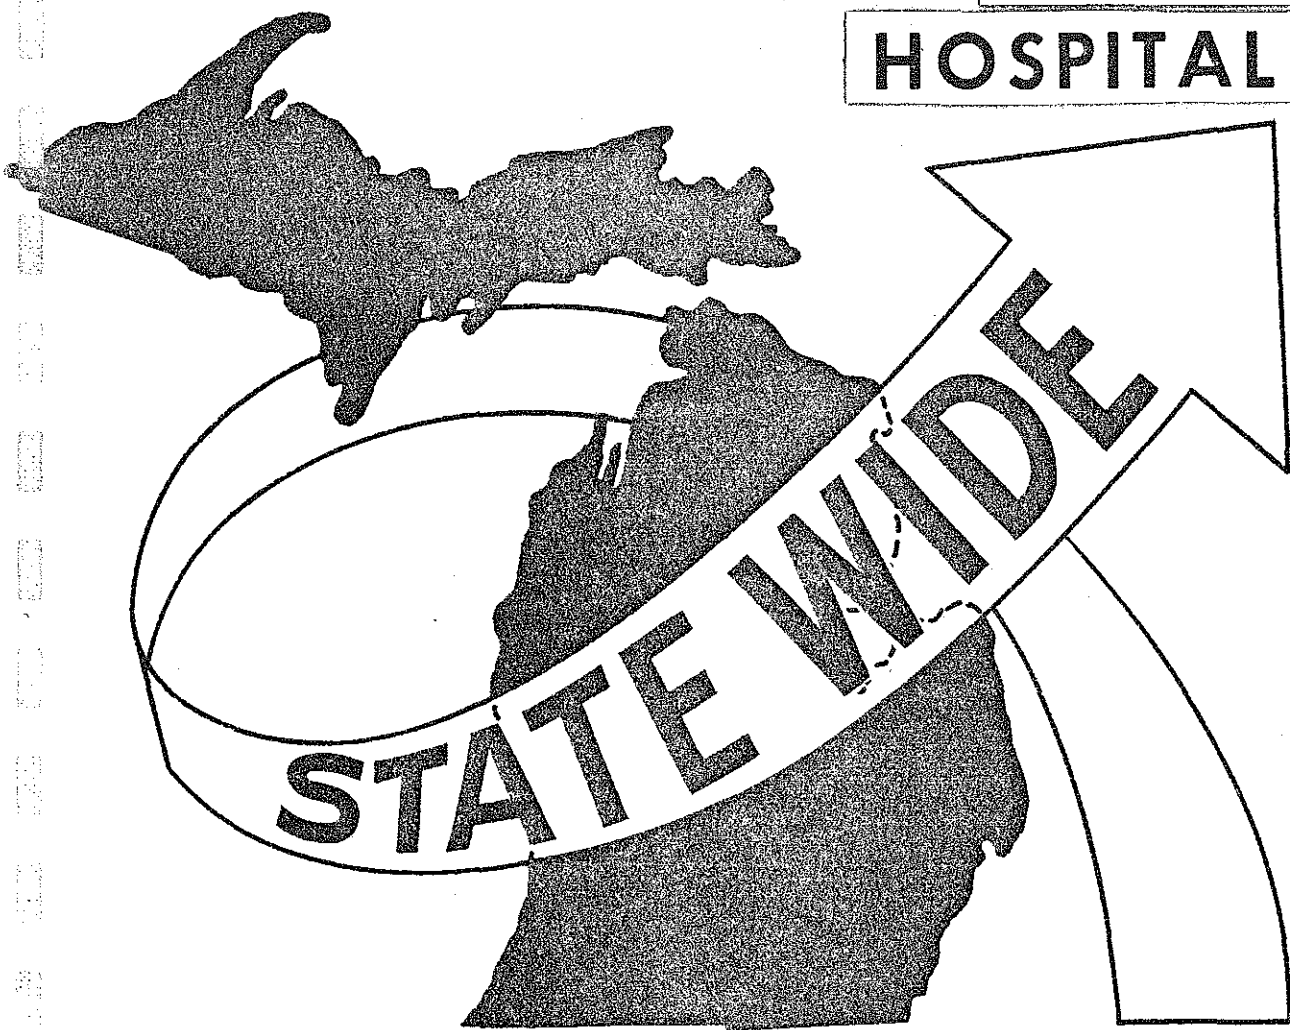

NEWSPAPERS

SEWAGE TREATMENT PLANTS

TOURIST ATTRACTIONS

The Statewide Studies Unit welcomes recommendations for future study considerations as well as comments or suggestions concerning the Proximity Analysis process itself. Proximity Analysis appears to be a powerful planning tool; any suggestions aimed at making it still more powerful would surely be appreciated.
