# INTRODUCTION

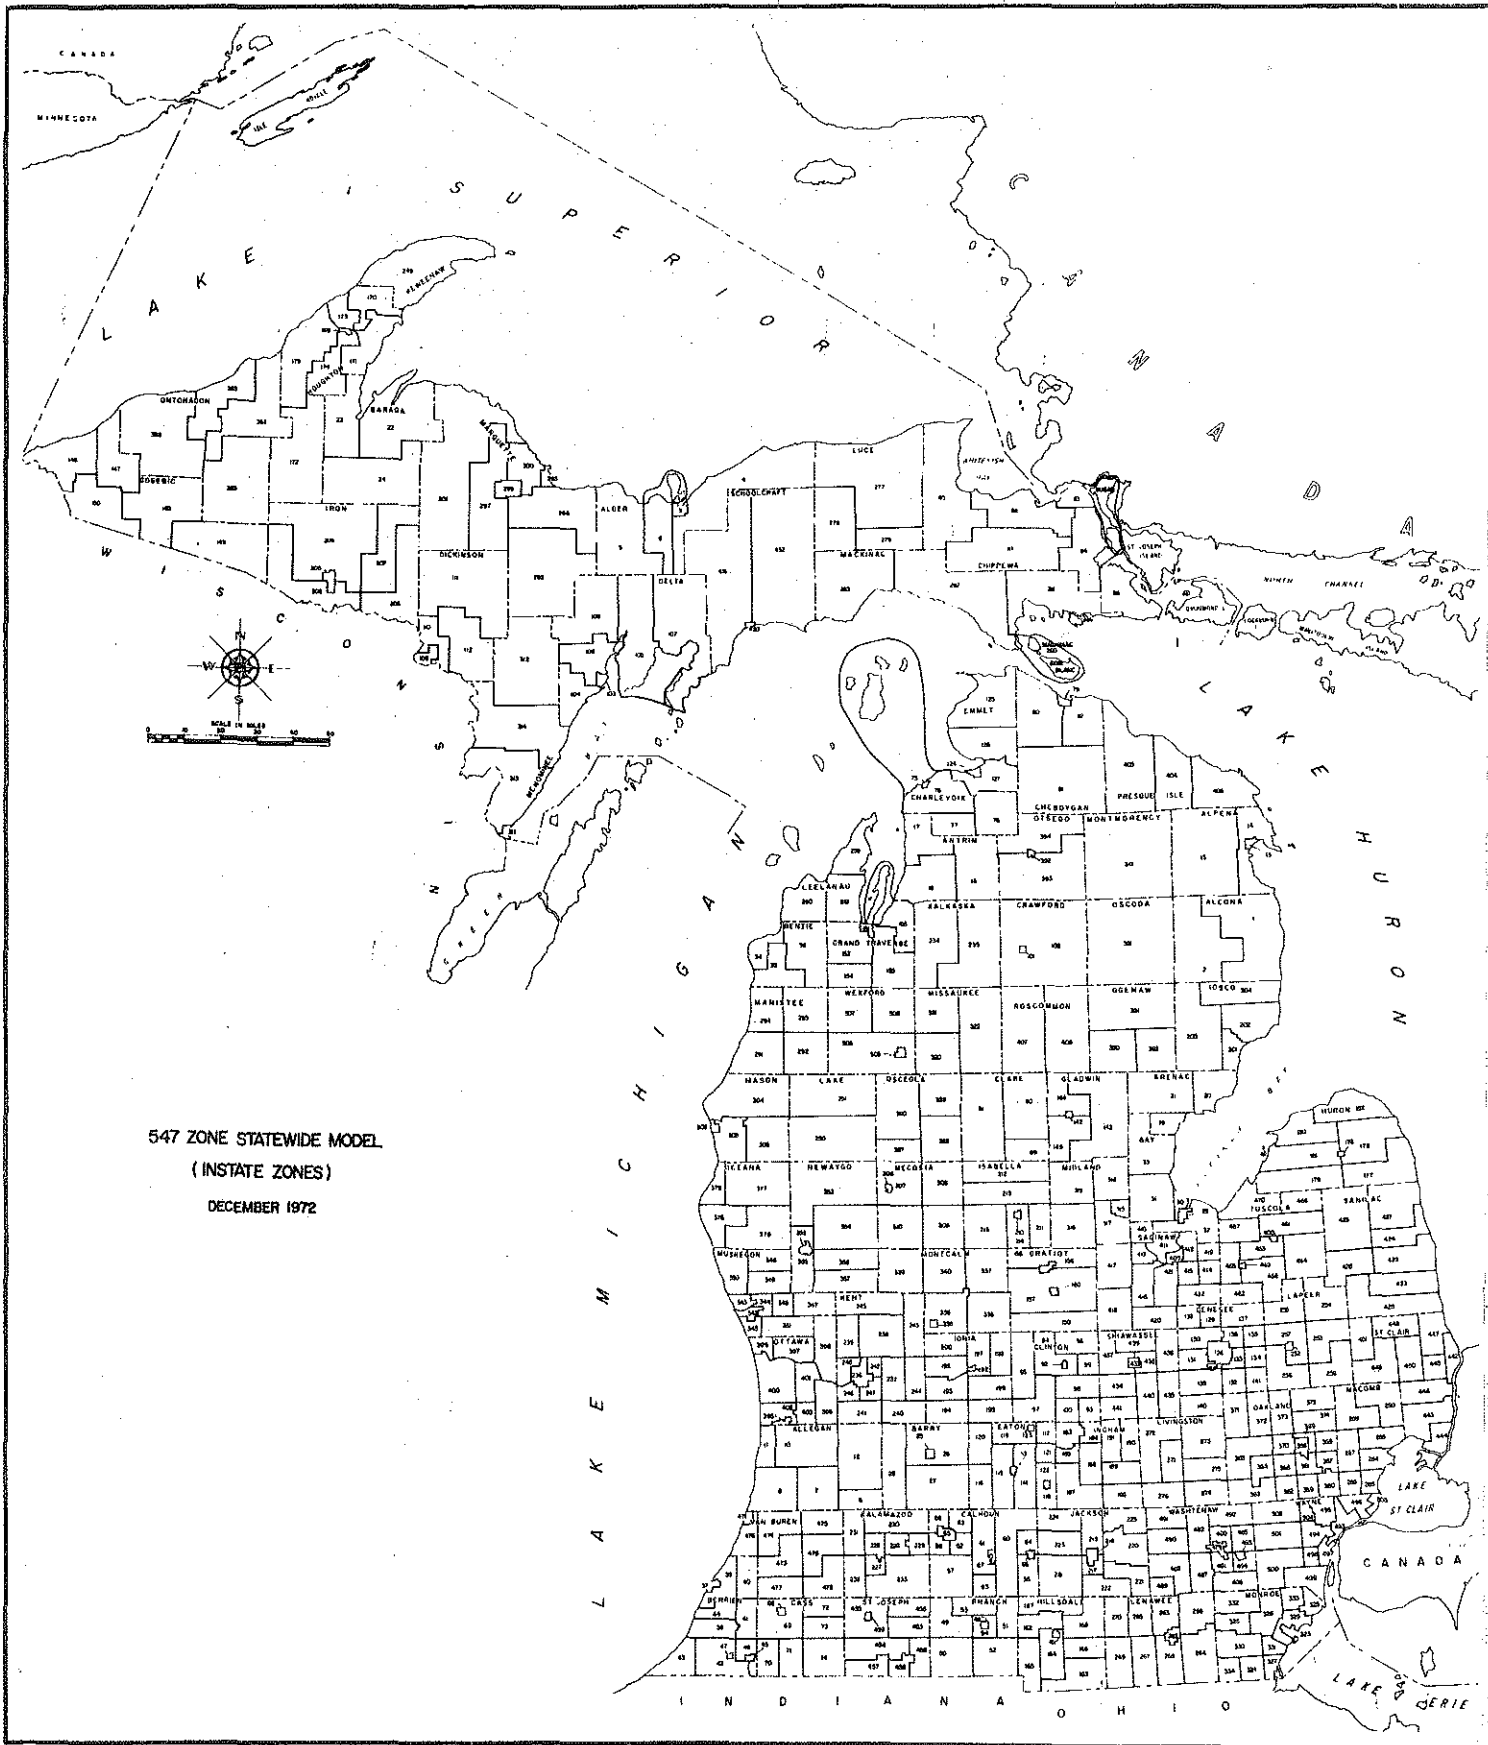

## INTRODUCTION

The current Statewide Transportation Modeling System contains 547 zones, 508 of which are in Michigan (see Figure 1). Any zone level data such as population, employment, or number of hospitals may now be mapped using the SYMAP program available at Michigan State University. Using the appropriate information SYMAP will produce a two-dimensional printer map of Michigan shaded according to the values of the data being displayed.

There presently exists a wide variety of socio-economic data already available at the statewide zone level (see Figure 2). The creation and use of this data was documented in a previous Statewide publication entitled Statewide Socio-Economic Data File, March, 1973. The Statewide Facility File offers additional information about statewide facilities such as hospitals, parks, and universities (see Figure 3). The creation and contents of this file was documented in a previous publication entitled Statewide Public and Private Facility File, March, 1973. All of the above mentioned information may be displayed with SYMAP as well as any new information coded to the Statewide Model zone system.

The following report is not intended to serve as a user's manual for SYMAP, but is intended to show some of the usual options and setups used in mapping the Statewide Model socio-economic zone data. More detailed information on SYMAP may be obtained from MSU publications.

# TYPES OF MAPS

## TYPES OF MAPS

Three types of maps are available with SYMAP.

1. Contour (see Figure 4)

All data points (508 instate zone centroids) having the same value are associated internally with a closed curved line (contour line). A continuous gradation is assumed between any two contour lines. This map should be used with continuous information such as population.

2. Conformant (see Figure 5)

Each data point is associated with a user-specified boundary surrounding the point. Each of these areas corresponds to a statewide zone. The area enclosed by each zone is shaded according to the value of the data for that zone. A blank border is produced showing the zone boundary.

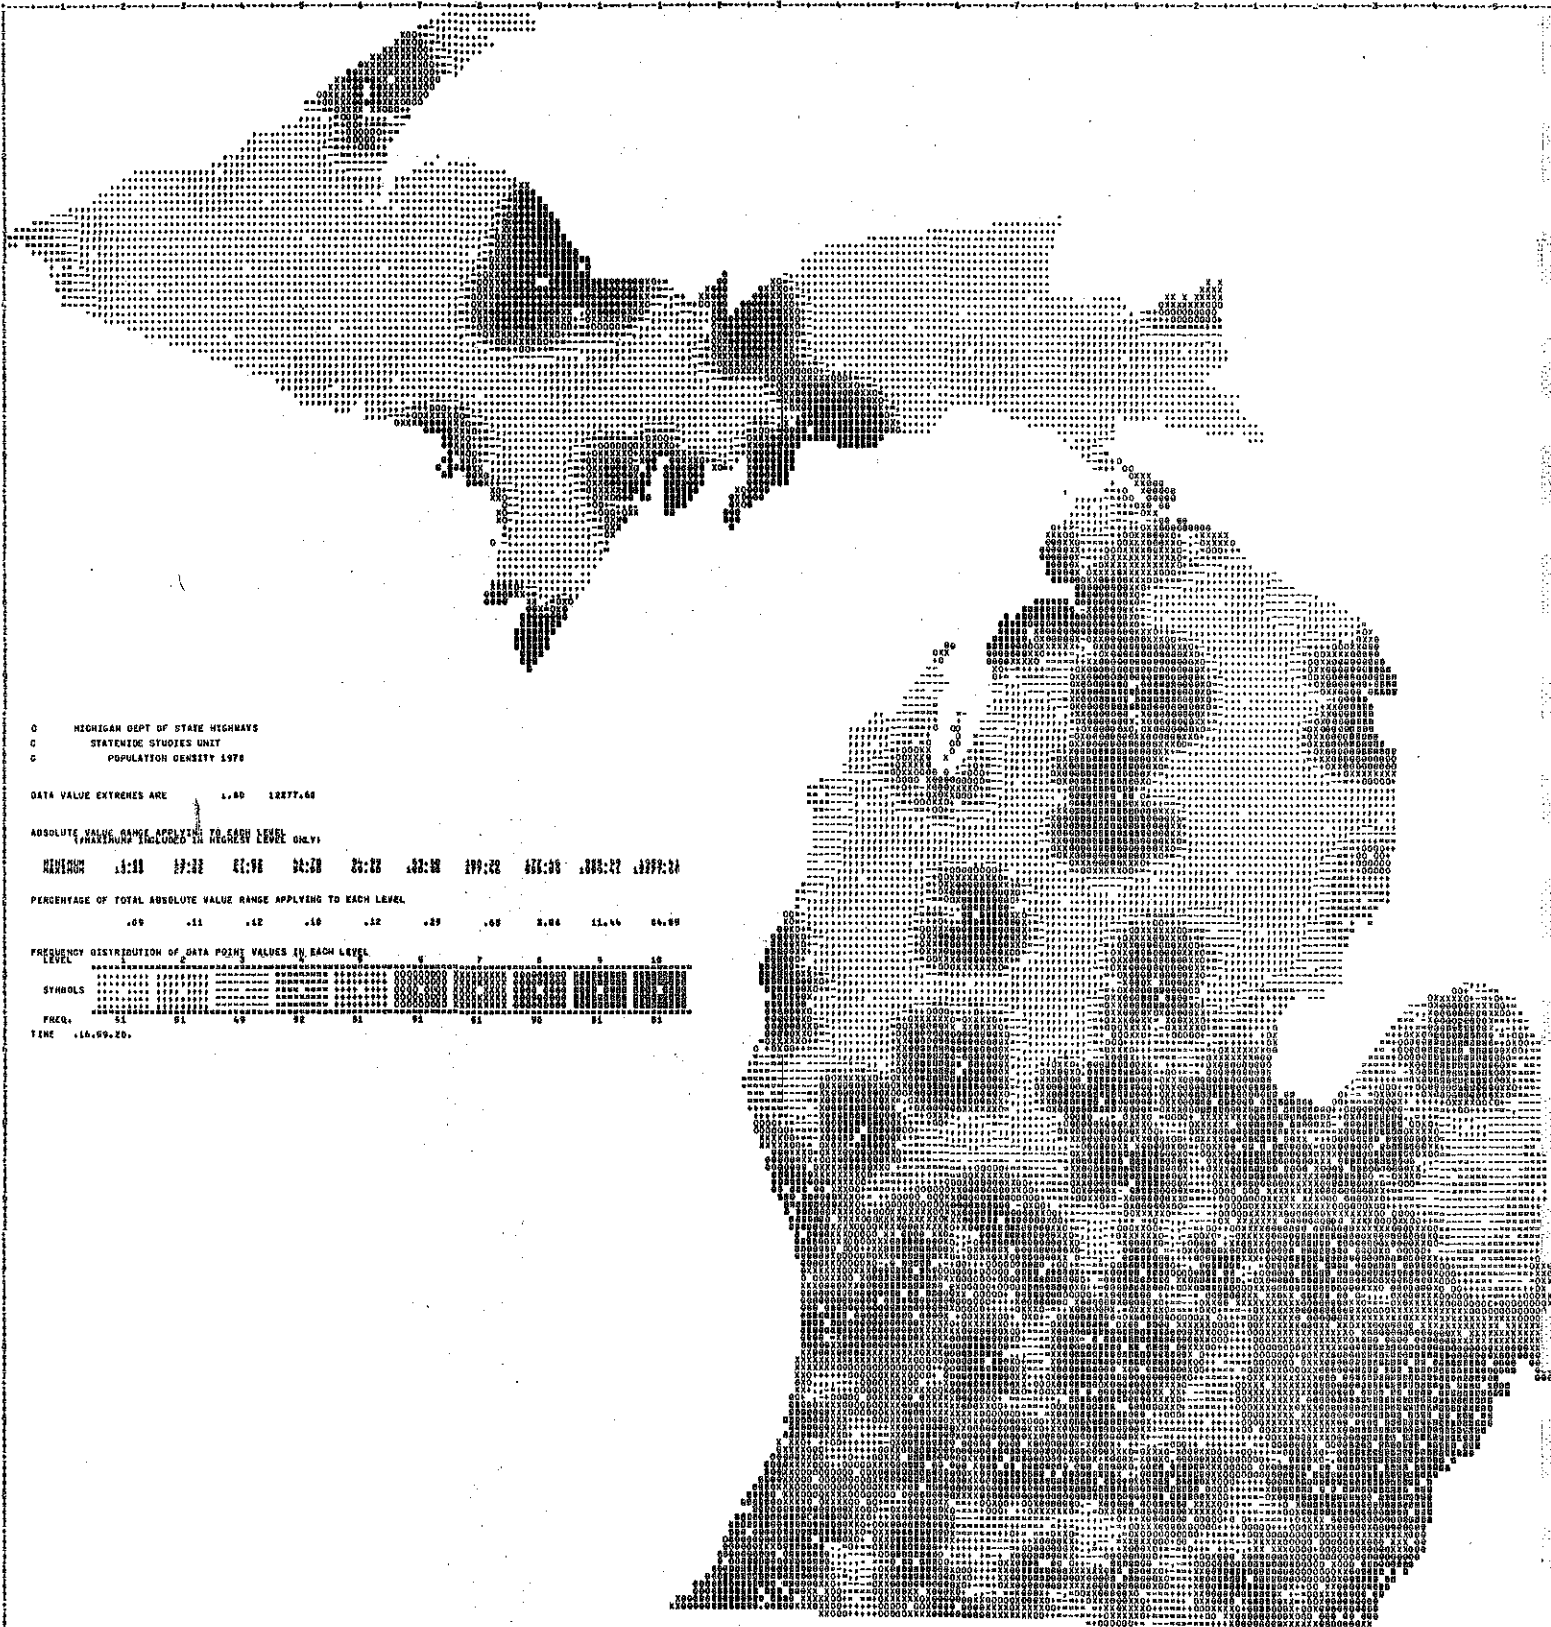

3. Proximal (see Figure 6)

The shading of each point on the output map is determined by the value of the nearest data point. Zone boundaries are not involved in this map or in the contour map.

Small blank squares can be seen on each map. These squares correspond to the position of the data points.

General instructions for setting up each type of map as well as control cards are discussed in the next section.

# TYPICAL SETUPS

## TYPICAL SETUPS

The necessary setup for running SYMAP at MSU on the CDC 6500 is shown in Figure 7. A description of usual packages and options for each type of map are discussed below.

For the details of coding each package see the MSU publication describing SYMAP. The cover of this publication is reproduced in Figure 8.

The packages need for a conformant (zone boundary) map are shown in Figure 9. An actual run deck is reproduced in Figure 10. In order to avoid loss of small zones a large map is needed. The 39 inch wide map is recommended. The map will then be printed in three strips and must be taped together for the completed map. This type of map should be used wisely since the cost is approximately 2 times the cost of contour or proximal maps. Based on computer costs at MSU the contour maps for the 508 instate zone system is around \$10.00

The packages for contour and proximal maps are illustrated in Figure 11.

The B-data points package for mapping the 2300 zone system will soon be available. Due to SYMAP's limit of 1000 data points, the 2300 system will require at least three runs of SYMAP to produce a complete state map.

The next sections deals with some specific suggestion regarding several options and how to put zone boundary coordinates on tape for use at MSU.

Use of F-Map Option 10 - Text Cards

The F-Map package always provides for three title cards to be printed at the base of the map.

It will often be desirable to have more cards to further explain each map. These extra cards may be submitted with Option 10. See the MSU publication for details.

Creation of Tape with Zone Boundary Coordinates.

Zone boundary coordinates for use with the A-Conformolines package may be punched on cards in the same format as suggested in the MSU publication. These cards should be loaded to tape with the B-5500 using Q17208. The tape should conform to the following:

1. 556 BPI
2. 80 char/record
3. 1 record/block
4. Even parity (i.e. non-standard)
5. Unlabeled

This tape should be logged in at MSU data center where a "VRN" number is assigned to the reel. To use this tape in SYMAP, a request card is included in the control cards. The format follows:

REQUEST, TAPE11, R0, VRN= , S, Z  
SYMAP ID      READ ONLY      INSERT VRN NUMBER      STRANGER TAPE      UNLABELED

Use of MSU County System

MSU has county data points, county boundaries, and an outline of Michigan available for use with SYMAP. Data points are geographic centers of the counties. County numbering conforms to the federal system (Saint Clair = 74). To obtain a card deck of the data points and outline use PNC card, JOB card, password card and the following APLIB card:

APLIB(LTT85,R\*AMI=PUNCH,BMI=PUNCH)

To run a county level SYMAP with county boundaries use the following APLIB card to obtain use at the A-Conformolines package of county boundaries:

APLIB(LTT85,R\*CMI=TAPE11).

Suggestions for mapping the 2300 zone system will be made available at a later date.
